

TECHSTORESys -- system architecture

Local-first desktop web app: one Python process on this PC serves the browser UI and writes one SQLite file. No cloud tenant. No live DAF/ERP feed.

LAYERED STACK (how the system is built)

REQUEST PATH -- login to durable save (Database mode)

PUT /api/state rejects a stale saveRevision with HTTP 409. Offline mode stops at the browser: IndexedDB holds appState until START-SYSTEM runs again. Source: server.py, launcher_service.py, app/js/config.js, app/js/boot.js.

Work surfaces, data stores and API

WORK SURFACES INSIDE THE UI

General ledger Five ICT votes, monthly targets, receipts, issues, buying power Roles: Store Officer, RQ, admin / oversight	Stores operations Q 1033, stock take, loans, unit equipment, undelivered, creditors Roles: Store Officer, Storeman, RQ	Intake Orderly Room Daily File, unit requisitions, document import Roles: Orderly clerk, Admin AO, TechStores
Procurement portals DP F1, quotes, CCS, spec eval, PO, MANAC, due diligence, supplier window Roles: DP, GS, DAF, AIAD, Nixzimo	Workshop Repairs register, receipt cert, Laptop Compare, H2H ICT crawl Roles: Workshop, OC Workshop	Control Dashboard alerts, reports, duties, user management, release cuts Roles: Admin; reports also for viewer / DAF

SQLITE FILE LAYOUT (techstores.db)

Table	Holds
users	id, username, PBKDF2 hash, role, active
settings	JSON blobs for most registers (appState keys)
gl_budgets	Vote ceilings per GL code
modules	Per-module payload JSON
release_cuts	Vote transfers between GLs
audit_log	login, save, and action trail

Operational lists (requisitions, creditors, inventory, Daily File) are not normalised tables. They round-trip as one appState document. Install: dist/TECHSTORES-Portable (START-SYSTEM.bat) or dist/TECHSTORES-Setup-1.0.0.0.exe. Keep TECHSTORES.exe with the app/ folder.

RUNTIME MODES

Database TECHSTORES.exe / server.py :8080 -- techstores.db next to the EXE
Offline TECHSTORES-OFFLINE.exe -- Browser IndexedDB, sync later
Launcher TECHSTORES-LAUNCHER.exe :8765 -- Does not store data; starts the other two

API SURFACE (server.py)

Method	Path	Job
GET	/api/health	Liveness, DB stats, AI status
GET	/api/state	Hydrate client appState
PUT	/api/state	Persist snapshot; 409 on revision conflict
POST	/api/login	Authenticate against users table
