

Work completed since Monday

TECHSTORESys - Zimbabwe National Army, IT Directorate

Report date: 01 September 2026

This document summarises development work carried out from Monday 31 August 2026 through Tuesday 1 September 2026. Changes span requisitions and orderly-room UX, system documentation (flow chart and data-flow diagram), Workshop comparison tools, form controls (typeable dropdowns and ZNA unit pickers), and a major Creditors register upgrade with intelligence panels across procurement workflows.

Monday 31 August 2026 - Requisitions & documentation

Requisitions in-tray - table and actions

- Requisitions table restyled for a cleaner, more readable layout (spacing, alignment, and column presentation).
- Removed separate In stock / Out of stock filter buttons from the toolbar to reduce clutter; stock status remains visible in the table columns.
- Row action buttons standardised: Route, Edit, Progress, Close arranged in a consistent pill/toolbar style; Delete removed from the main requisitions in-tray.
- Undelivered Items row actions (Edit, Done, Del) aligned to the same visual style.

Orderly Room integration

- Requisitions in-tray mirror added to Orderly Room so clerks see incoming unit requests in the same tabular format (date in, unit, items, stock status, age).

System flow chart & data-flow diagram

- HTML system flow chart page created showing end-to-end TECHSTORESys modules and process paths (requisition through issue, procurement, creditors, workshop, etc.).
- Separate HTML Data Flow Diagram (DFD) page added using standard notation: external entities, processes, data stores, and labelled flows.
- PDF copies of both the operational flow chart and the DFD generated for printing and briefing.

Desktop deployment

- Guidance and launcher/installation packaging work so TECHSTORESys can run from the desktop (portable EXE / START-SYSTEM batch workflow).
- Git commit and push of the above changes; subsequent pull/push to sync dev and desktop copies.
- Investigated version drift: an earlier Laptop Compare concept existed on the desktop build but had diverged from the repository - root cause was unsynced portable build vs active development branch.

Workshop - comparison tools (first pass)

- Laptop Compare module restored under Workshop navigation - catalog-based ranking with duty-profile scoring and recommended buy.
- H2H ICT Comparison extended beyond laptops to desktops, printers, servers, and other ICT categories via category/extra filters.
- Removed the previous four-machine selection cap; all ranked candidates can be selected and compared.
- Recommended Buy banner and Buy Score Ranking chart restyled (green winner card, purple/red score bars, spec-score inset, side-by-side comparison table).

Tuesday 1 September 2026 - Workshop, forms & Creditors

Two separate Workshop comparison modules

- Laptop Compare and H2H ICT Comparison kept as distinct nav buttons under Workshop:
- Laptop Compare - buy-the-winner from local catalog and duty profiles.
- H2H ICT Comparison - web crawl, head-to-head ranking, search history.
- Both modules wired into config roles, dashboard labels, module loader, manifest, and universal search.

H2H crawl quality improvements

- Tightened article/product detection to exclude Amazon category pages, CPU-only benchmark articles, and generic shopping landing pages.
- Visible-item filtering respects selected category and extra keyword so irrelevant rows drop out of the grid and comparison.
- Search history retained so repeat duty/category searches recall cached results without re-crawling.

Typeable combobox fields (mountTypeableSelect)

- New reusable typeable select component in utils.js: type to filter, scrollable dropdown, keyboard navigation, optional custom values.
- Applied to Laptop Compare search fields: Duty profile, Brand, Minimum RAM, Minimum storage.
- Fixed dropdown clipping (portal list to document body, z-index 15000, overflow visible on compare panels) and restored duty-profile list on focus.

ZNA Units, Formations and Establishments

- Official establishment manual data consolidated in zna-units.js with grouped formations and units.
- wireAllZnaUnitFields() runs on every loaded module; legacy filter+select pairs replaced with single typeable unit pickers.
- Unit/formation fields upgraded across: Requisitions, ICT Accountability, Monthly Returns, Orderly Room, Workshop Receipt Cert, Accommodation Stores, Repair Intake, Temporary/Permanent Loans, Office Messages, Doc Import apply-path, and table cells.

Creditors register (formerly Supplier Debts)

- Imported IT DIR creditors Excel: IT CREDITORS RETURN AS AT 05 NOV 2025 RQ.xlsx.
- Python parser (creditors_parse.py) + seed file (it-dir-creditors-seed.js): 24 supplier cases, 70 invoice lines, USD 958,449.69 total, register date 2025-11-05. Vendor-code grouping merges duplicate supplier name variants.
- Module renamed user-facing to Creditors (nav, dashboard, alerts, dept home, process guides); internal ID remains supplier-debts for data compatibility.
- Import panel with built-in seed load, merge modes, drag-and-drop Excel import via POST /api/creditors/parse (requires START-SYSTEM).
- DAF payment-proof import: POST /api/creditors/parse-paid + creditors_paid_parse.py; matches supplier/PO/invoice/amount and marks cases paid after preview.

Intelligence panels - smart system upgrades

- Creditors: priority DAF chase ranking, duplicate supplier detection, one-click merge of duplicate cases, paid-list drop zone.
- Undelivered Items: priority supplier follow-up list and supplier backlog statistics.
- Requisitions: respond-first list (urgent + oldest), in-tray checks for overdue, urgent, and out-of-stock lines.

Key files touched

Frontend: app/js/requisitions.js, orderly-room.js, undelivered.js, supplier-debts.js, creditors-import.js, it-dir-creditors-seed.js, laptop-compare.js, ict-compare.js, utils.js, zna-units.js, module-loader.js, dashboard.js, config.js, doc-import.js, ict-accountability.js, and related module HTML/CSS.

Backend: server.py (creditors parse endpoints), creditors_parse.py, creditors_paid_parse.py, scripts/parse-it-creditors-xlsx.py.

Documentation: app/system-flow or data-flow-diagram HTML pages and companion PDFs.

How to verify

- Hard refresh the browser (Ctrl+F5) after pulling latest code.
- Restart START-SYSTEM for creditors Excel import and paid-list APIs.
- Workshop: confirm both Laptop Compare and H2H ICT Comparison nav buttons.
- Laptop Compare: type in duty profile - dropdown should list all profiles.
- Creditors: open module - seed loads 24 cases; try drag-drop import panel.
- Requisitions / Undelivered: check intelligence panels at top of each module.

Outstanding / notes

- Portable dist/TECHSTORES-Portable/ may need rebuild to match dev branch on desktop.
- Dampack may appear twice (detailed seed case + register row) - manual merge available.
- Live DAF/ERP payment feed not connected - paid status is import/manual only.
- No git commit was made for this write-up unless explicitly requested.

Prepared from development session transcript and repository diff. Restricted source documents supplied for design only are not retained in the system.
